

Numerical

- i) Given memory partitions of 100 KB, 500 KB, 200 KB, 300 KB & 600 KB (in order), how would each of the first-fit, best-fit & worst-fit algorithms place processes of size 212 KB, 417 KB, 112 KB & 426 KB (in that order)? Which algo. makes the most efficient use of memory?

Partitions :- 100KB, 500KB, 200KB, 300KB, 600KB

Processes :- 212KB, 417KB, 112KB, 426KB
 P_1 P_2 P_3 P_4

→ First Fit

P_4 (426KB) cannot be added.

Best Fit

Worst Fit

P_4 (426KB) cannot be added.

∴ Efficient algorithm is best fit.

2) Partitions 150K, 350K

Processes 300K, 25K, 125K, 50K
 P_1 P_2 P_3 P_4

→ First Fit

Best Fit

50K(P_4) cannot be added (External fragmentation)

Worst Fit

First Fit & Worst Fit are efficient algorithms.

* First Fit, Best Fit, Worst Fit Numerical

Process Allocate memory for additional request of 4K & 10K. Compare the memory allocation using first fit, best fit, worst fit allocation methods in terms of external fragmentation.

→ Solution

$$P_1 = 4K, P_2 = 10K$$

It leaves fragmentation of $6K + 5K = 11K$.

Best Fit

It leaves fragmentation of $0K + 1K = 1K$.

Page No.

Date

Worst Fit

It leaves fragment of 8K

Best method is Best fit
