## NORMAL DISTRIBUTION:

\* The Normal Distribution is called as Gaussian Distribution.

\* It is also called as bell-curve.

\* The major distribution lies in Mean.

\* In normal distribution Mean = Median = Mode.

\* The Normal Curve is symmetric about the Mean.

\* The Mean parameter serves as a location parameter.

\* The Standard Deviation is a scale parameter.  
→ Different curve gives different scale.

\* From the diagram  $(M+6)$  is one standard deviation away from the mean in right side.  
 $M+2\sigma$  is two standard deviation away from the right side.  $M+3\sigma$  is three standard deviation away from the right side. It is called as influence point.

### STANDARD NORMAL FORM AND QQ-PLOTS:

\* A Q-Q plot, or quantile - quantile plot is a scatter plot created by plotting two sets of quantiles against one - another.

\* If both sets of quantiles come from the same distribution, we see that the points forming a line is roughly a straight line.

\* We mention here an example of a normal Q-Q plot when both sets of quantiles truly comes from normal distribution.

\* Quantiles are often referred to as 'percentiles'. These are points in the data set below which a certain proportion of data fall.

\* For example, consider the bell-shaped standard normal distribution with mean of 0.

\* The 50<sup>th</sup> percentile is 0.

\* Half of the data lie below 0.

\* The 95% of data lie below 1.64 from the given example.

\* Since the data is normally distributed, the QQ-plot generates a straight line.

\* The example 2 clearly describes how the QQ plot is generated.

\* Y axis takes the sample data and X-axis takes the normal Distribution Data

\* They are together plotted in QQ-Plot. If it generates a straight line then it is normal distribution.

### LONG TAILED DISTRIBUTION

\* In statistics, a long tail of some distributions of numbers is the portion of the distribution having many occurrence, and they are far from the "head" or central part of the distribution.

\* The above graph shows long-tail distribution. To the right (dotted part) is the long tail and to the left (lined segment) are the few that dominate
