

Semester: IISubject: DSGTAcademic Year: 2022-2023ex. If  $A \subseteq B$  then  $P(A) \subseteq P(B)$ .

$\Rightarrow$  Let  $C \in P(A)$  Then  $C \subseteq A$  which implies  $C \subseteq B$   
 $C \in P(B)$   
 $P(A) \subseteq P(B)$

### \* Functions :-

Definition - Let  $A$  and  $B$  be non-empty sets. A function  $f$  from  $A$  to  $B$ , denoted as

$f: A \rightarrow B$ , is a relation from  $A$  to  $B$  such that for every  $a \in A$ , there exists a unique  $b \in B$  such that  $(a, b) \in f$ .

Normally if  $(a, b) \in f$ , we write  $f(a) = b$ .

Property of function :

If  $f(a) = b$  and  $f(a) = c$   
then  $b = c$

This condition implies that to each element  $a \in A$ , a unique element  $b \in B$  should be assigned by the relation  $f$ .

As  $f$  is a relation we may also express  $f$  as a set of ordered pairs, i.e.

$f = \{(a, f(a)) \mid a \in A, f(a) \in B\}$

domain of a function is uniquely defined, because function acts on every element of the domain.

Semester: IIISubject: DSGT

Academic Year: 2022-2023

Function can be represented in graphical and tabular form.

e.g. Let A be a set of

$$A = \{a, b, c, d, e, f\}$$

$$B = \{\alpha, \beta, \gamma, \delta\}$$

Graphical Repre<sup>n</sup>Tabular repres<sup>n</sup>

Domain

codomain

A

Range

The Set A is called as the domain of  $f$ , denoted by  $\text{Dom}(f)$ . The set B is called as the codomain, and set  $\{f(a) \mid a \in A\}$  which is a subset of B, is called as range of  $f$ .

Semester: III

Subject: DSGT

Academic Year: 20 - 20

and denoted by  $\text{Ran}(f)$ . And set  $B$  is called as codomain.

### Pre-image and Image of a function -

A function  $f: A \rightarrow B$  such that for each  $a \in A$ , there exists a unique  $b \in B$  such that  $(a, b) \in R$  then  $a$  is called the pre-image of  $f$  and  $b$  is called the image of  $f$ .

### \* Types of functions -

#### 1) Onto or Surjective function -

A function from  $A$  to  $B$  is said to be an onto function if every element of  $B$  is the image of one or more elements of  $A$ .

Onto function is also called as surjective or ' $f$ ' is ONTO if  $\text{Ran}(f) = B$ .

$\therefore f: A \rightarrow B$  is onto if for each  $b \in B$ , there exists  $a \in A$  such that  $f(a) = b$

Let  $A = \{a, b, c\}$  and  $B = \{1, 2\}$  are two sets.

$$\therefore f(a) = 1 \quad f(b) = 2$$

$$f(c) = 2.$$

This is onto fun<sup>n</sup>.

Semester : III

Subject : DSGT

Academic Year: 2022-2023

ex. Let  $A = \{1, 2, 3, 4\}$  and  $B = \{a, b, c, d\}$  and  
 $f = \{(1, a), (2, a), (3, d), (4, c), (3, b)\}$   
 $f(1) = a$   $f(2) = a$   $f(3) = d$   $f(4) = c$   $f(3) = b$   
 $\text{Ran}(f) = \{a, d, c, b\} = B$   
So this fun<sup>n</sup> is onto function.

② One to One or Injective function -

A function from A to B is said to be a one to one function if no two elements of A have the same image. One to one function is also called as injective function.

ex. Let  $A = \{1, 2, 3, 4\}$  and  $B = \{a, b, c, d, e\}$   
and  $f = \{(1, a), (2, e), (3, c), (4, d)\}$

$$f(1) = a \quad f(2) = e$$

$$f(3) = c \quad f(4) = d$$

This is one to one or injective fun<sup>n</sup>

Semester: III

Subject: DSGT

Academic Year: 2022-2023

3) One to one onto function or Bijective fun<sup>n</sup>.

A function from A to B is called as one to one onto function if it is both an onto and one to one function. One to one onto fun<sup>n</sup> is also called as bijective function.

ex. Let  $A = \{1, 2, 3, 4\}$

$B = \{a, b, c, d\}$

and  $f = \{(1, b), (2, c), (3, d), (4, a)\}$

$f(1) = b$   $f(2) = c$   $f(3) = d$   $f(4) = a$

this fun<sup>n</sup> is bijective fun<sup>n</sup>

4) Every where Defined function -

A function from A to B is said to be every-where defined if  $\text{Dom}(f) = A$ .

ex. Let  $A = \{1, 2, 3\}$   $B = \{a, b, c\}$

and  $f = \{(1, c), (2, b), (3, a)\}$

$f(1) = c$

$f(2) = b$

$f(3) = a$

This is everywhere defined function

$\text{Dom}(f) = \{1, 2, 3\}$

Semester: III

Subject: DSGT

Academic Year: 2022-2023

## \* Examples on functions -

① Let  $A = \{a_1, a_2, a_3\}$ ,  $B = \{b_1, b_2, b_3\}$ ,  $C = \{c_1, c_2\}$ ,  $D = \{d_1, d_2, d_3, d_4\}$  consider the following four functions from  $A$  to  $B$ ,  $A$  to  $D$ ,  $B$  to  $C$  and  $D$  to  $B$  respectively.

a)  $f_1 = \{(a_1, b_2), (a_2, b_3), (a_3, b_1)\}$

b)  $f_2 = \{(a_1, d_2), (a_2, d_1), (a_3, d_4)\}$

c)  $f_3 = \{(b_1, c_2), (b_2, c_2), (b_3, c_1)\}$

d)  $f_4 = \{(d_1, b_1), (d_2, b_2), (d_3, b_1)\}$

Determine whether each function is one to one, whether each function is onto and whether each fun<sup>n</sup> is everywhere defined.

⇒ a)  $f_1 = \{(a_1, b_2), (a_2, b_3), (a_3, b_1)\}$

$f_1(a_1) = b_2$        $f_1(a_3) = b_1$

$f_1(a_2) = b_3$

$f_1$  is everywhere defined  $\text{Dom}(f_1) = A$

$f_1$  is onto because  $\text{Range}(f_1) = B$

$f_1$  is also one to one fun<sup>n</sup> because no two elements of set  $B$  have same image.

So  $f_1$  is surjective, injective, bijective and everywhere defined fun<sup>n</sup>.

Semester: III

Subject: DSGT

Academic Year: 2022-2023

b)  $f_2 = \{(a_1, d_2), (a_2, d_1), (a_3, d_4)\}$

$f_2(a_1) = d_2$        $f_2(a_2) = d_1$

$f_2(a_3) = d_4$

$f_2$  is everywhere defined as  $\text{dom}(f_2) = A$

$f_2$  is not onto fun<sup>n</sup>  $\text{Ran}(f_2) \neq D$ .

$f_2$  is one to one fun<sup>n</sup>.

c)  $f_3 = \{(b_1, c_2), (b_2, c_2), (b_3, c_1)\}$

$f_3(b_1) = c_2$

$f_3(b_2) = c_2$

$f_3(b_3) = c_1$

$f_3$  is everywhere defined fun<sup>n</sup> because.

$\text{Dom}(f_3) = B$

$f_3$  is onto surjective fun<sup>n</sup> because

$\text{Ran}(f_3) = C$

$f_3$  is not one to one fun<sup>n</sup>.

Semester : III

Subject : DSGT

Academic Year: 2022 - 2023

d)  $f_4 = \{(d_1, b_1), (d_2, b_2), (d_3, b_1)\}$

$f_4(d_1) = b_1$

$f_4(d_2) = b_2$

$f_4(d_3) = b_1$

$f_4$  is not onto fun<sup>n</sup> because  $\text{Ran}(f_4) \neq B$

$f_4$  is not everywhere defined fun<sup>n</sup> because  $\text{Dom}(f_4) \neq D$ .

$f_4$  is not one to one fun<sup>n</sup> because two elements of set  $D$  have same image.

ex:

Let  $A = B = \mathbb{R}$ , the set of real numbers. Let  $f: A \rightarrow B$  be given by the formula  $f(x) = 2x^3 - 1$  and let  $g: B \rightarrow A$  be given by  $g(y) = \sqrt[3]{\frac{1}{2}y + \frac{1}{2}}$ .

Show that  $f$  is bijection between  $A$  and  $B$  and  $g$  is a bijection between  $B$  and  $A$ .

$\Rightarrow$  A function from  $A$  to  $B$  is Bijection if it is one to one and onto.  
 $\therefore$  for  $f(x) = 2x^3 - 1$  to be one to one & onto.

Semester: III

Subject: DSGT

Academic Year: 2022-2023

If  $a, b \in A$

Such that  $f(a) = f(b)$

$\Rightarrow$

$$2a^3 - 1 = 2b^3 - 1 \quad \cancel{2}a^3 = \cancel{2}b^3 = a^3 = b^3$$

$$a = b$$

$\therefore f$  is one to one.

Now for  $y = 2x^3 - 1$

$$1 + y = 2x^3$$

$$x^3 = \frac{1}{2} + \frac{y}{2}$$

$$x = \sqrt[3]{\frac{1}{2} + \frac{y}{2}}$$

$\therefore$  for each  $y \in B$ , there is a unique  $x$  in  $A$  such that  $f(x) = y$ .

$f$  is onto.

$\therefore f$  is bijective fun<sup>n</sup> between  $A$  and  $B$ .

Similarly for  $g: B \rightarrow A$  to be one to one & onto

$$g(a) = g(b) = \sqrt[3]{\frac{1}{2} + \frac{a}{2}} = \sqrt[3]{\frac{1}{2} + \frac{b}{2}}$$

$$\cancel{\frac{1}{2}} + \frac{a}{2} = \cancel{\frac{1}{2}} + \frac{b}{2}$$

$$\frac{a}{2} = \frac{b}{2} \quad \Rightarrow \quad \frac{1}{2} a = \cancel{\frac{1}{2}} b$$

$$\therefore a = b$$

$g$  is one to one.

Semester: III

Subject: DSGT

Academic Year: 2022-2023

also for  $x = \sqrt[3]{\frac{1+y}{2}}$

$$x^3 = \frac{1+y}{2}$$

$$x^3 = \frac{1+y}{2}$$

$$2x^3 = 1+y$$

$$y = 2x^3 - 1$$

for each  $x$  in  $A$ . There is a corresponding  $y$  in  $B$ .

such that  $g(y) = x$ .

$\therefore g$  is onto function

so  $g$  is bijective fun<sup>n</sup> bet<sup>n</sup>  $B$  and  $A$ .

May 18  
ex.

Test whether the following function is one-to-one onto or both.

$$f: \mathbb{Z} \rightarrow \mathbb{Z}, f(x) = x^2 + x + 1$$

$\Rightarrow$  A function from  $A$  to  $B$  is one to one if no two elements of  $A$  have the same image.

let,  $x = -2$ ,  $f(x) = x^2 + x + 1$

$$f(-2) = (-2)^2 + (-2) + 1$$

$$= 4 - 2 + 1$$

$$= 3$$

(let  $x = 1$ )

$$f(1) = 1^2 + 1 + 1 = 3$$
 Elements 1 and -2

have same image so the function is not one to one.
