16 blocks with 15 numbers arranged randomly & we need to achieve the goal arrangement with min^m no of shifts.

Blank column can be shifted in any directions

check to the node with ~~less cost~~ ^{less cost} is branched & other nodes will be bounded.

Example $\hat{C}(x) = f(x) + \hat{g}(x)$

1 2

where

$\hat{C}(x)$ = 2s the estimated min cost to reach the goal node

$f(x)$ = No of move from initial state

$\hat{g}(x)$ = No of non-blank that are not in their goal position.
